Summary of Article Overviews on the Predictive Policing System ①–⑬ (1,500-character version)

Predictive Policing System ①: The Arrival of an Era in Which Sending Is Blocked Just by Thinking, and AI Conditions and Controls People (Unfinished Version)

The central theme is to interpret the phenomenon in which social media posts and communications are obstructed “just by thinking” as a composite system of surveillance, AI, communication blocking, and psychological conditioning. On X, there are many reports of damage such as likes and reposts disappearing, errors appearing when trying to post, and accounts being locked for inconvenient posts. The example of hearts disappearing on posts related to Princess Aiko is also given and treated as an anomaly difficult to explain by coincidence.

Chapter 1 links the structure in which telling the truth or expressing correct opinions leads to repression with backlash against opposition to war or pointing out naphtha shortages, net-uyoku-style group lynching, and fascism and militarization under the Takaichi administration. It quotes Prince Mikasa Takahito’s words—“Those who tell lies are praised as patriots, and those who tell the truth are denounced as traitors”—and views the same inversion of values as occurring today.

Chapter 2 explains the structure in which facts are distorted by the power of money through examples from the AV industry and historical revisionism. It organizes that people who flatter those in power and the wealthy for rewards increase, and there is a mechanism in which those who tell the truth lose out. Chapter 3 touches on moves to incite war and constitutional revision through enormous advertising budgets and to stage consent by holding people’s weaknesses.

Chapter 4 lists the phenomena of the predictive policing system. Within one second of thinking, Wi-Fi or VPN cuts out, the send button cannot be pressed, the notepad crashes, the mouse or screen freezes, and on X sending criticism of Takaichi, notifications, likes, reposts, and translation are obstructed, and stomach growling, strange odors, and abdominal pain occur. It uses the “time wall” by which humans recognize causality and causes anomalies within several hundred milliseconds to make people feel they are being monitored.

Chapter 5 divides the mechanism into five layers: brainwave detection, edge processing, intent detection by AI, physical blocking of communications, and giving up through learned helplessness. It also touches on Palantir and ICE’s surveillance systems and organizes that the aim is ultimately “conditioning” that makes people give up on sending or whistleblowing. Chapter 6 uses Palantir’s ImmigrationOS and ELITE predictive enforcement for immigration raids as an example and explains that surveillance has changed from “after-the-fact response” to “prediction first.”

Chapter 7 deals with the contradiction that external ambulances, reckless motorcycles, and airplane sounds occur within several hundred milliseconds. Considering the speed of sound propagation, it is physically difficult for a distant sound source to arrive immediately after a thought, so it presents the structure in which AI issues commands in advance and uses thoughts as a synchronization signal. In conclusion, prediction is in name only; the reality is a system that dominates thought and action.

Predictive Policing System ②: The Mechanism of Human Body Hacking (Unfinished Version)

The central theme is to grasp the phenomenon in which people who say the right thing or whistleblow on harm are repressed and inexplicable anomalies occur in their bodies as an extension of human body hacking and state-level surveillance and military technology. Chapter 8 organizes, through examples such as attacks on UN official Francesca Albanese, sanctions against ICC judges, and threats and harassment against Epstein case victims, that a structure in which telling the right thing leads to loss is being created internationally as well. It shows the tactics of labeling victims “crazy” or “liars,” exposing their addresses and locations, attacking those around them, and isolating them.

Chapter 9 lists the phenomena that occur as human body hacking: insects attacking, crows cawing at convenient times, people following the target appearing, drowsiness while driving, eye discharge making it hard to see, blurred vision, glare from oncoming car headlights, throat tightness, coughing and nausea, increased heart rate, strange odors, muscle spasms, stomach growling, flatulence, and abdominal pain. Because these occur in linkage with thoughts and speech, it explains the situation in which they are felt not as coincidental poor health but as deliberate attacks. Because they resume after temporarily decreasing even after moving, it views the system as an “eye of God” with no escape.

Chapter 10 divides the body into “parts moved by conscious will,” “parts that move automatically,” and “mixed types.” Arms and muscles can be moved by will, but digestion and the autonomic nervous system are automatic. When abdominal pain or diarrhea occurs while writing litigation documents, it organizes that interference is established by the reaction of an externally manipulated automatic system intruding into conscious work.

Chapter 11 deals with the possibility of controlling brain regions and external manipulation. It states that magnetic nanoparticles and magnetoelectric nanoparticles may be able to convert external magnetic fields into local electric fields to control and

record neural activity in deep brain regions. It emphasizes that because magnetic fields are used, blocking and defense are difficult.

Chapter 12 takes up the U.S. military invasion of Venezuela on January 3, 2026, and the deaths of 32 Cuban military personnel. It links the asymmetric casualty ratio, with almost no human losses on the U.S. side, to a remote sensing and AI location identification system called Ghost Murmur. It shows the possibility that the predictive policing system has expanded from blocking individual transmissions to state-level target elimination and organizes that surveillance, AI analysis, precise location identification, and advance action share the same technological foundation.

Predictive Policing System ③: The Mechanism by Which “Magnetic Nanoparticles” Control the Brain and Body (Unfinished Version)

The central theme is the history of intelligence agencies' pursuit of human domination and control and the reality of technology that manipulates the brain and body from outside using magnetic nanoparticles. Chapter 13 cites the CIA's MKUltra project, Unit 731, and the Epstein files and organizes that interest in human experimentation and mind control has continued. It also shows the 1977 and 2026 hearings and the problems of document destruction and redaction.

Chapter 14 takes up NANO-Mind, announced in 2024 by Korea's IBS and Yonsei University. It is a technology that remotely controls specific brain regions of mice with magnetized nanoparticles and magnetic fields, increasing or decreasing appetite and triggering maternal behavior. It explains the ability to operate without drilling a hole in the skull and completely wirelessly as a difference from conventional optogenetics.

Chapter 15 deals with the danger if this technology falls into the hands of a dictatorial regime. It warns that magnetized nanoparticles may be contained in food and vaccines, and a foundation for remote control could be created without ordinary citizens noticing. It also touches on the need for ethical guidelines, the Terminator soldier plan introduced on an Ikegami Akira program, hacking through direct brain stimulation, the datafication of memory, and cyborg soldier concepts.

Chapter 16 explains the possibility of reading brain signals with magnetic nanoparticles. Magnetoelectric nanoparticles convert external magnetic fields into local electric fields and can stimulate neurons, while also detecting neuron activity as magnetic signals, so they can become the foundation of bidirectional BCI. It states that MPI can constantly monitor magnetic nanoparticles and map cerebral blood flow and activity. It shows the danger that combining suppression of the amygdala, which governs fear, linking of pleasure and combat behavior, suppression of the prefrontal cortex, and monitoring of signs of rebellion could create soldiers obedient to orders.

Chapter 17 deals with abnormalities in magnetic fields and magnetic flux density reported by gang stalking victims, the phenomenon of fingers and arms spasming with TMS, the possibility of controlling electric currents and magnetic fields in smart houses, and simulation through digital twins. It emphasizes that because magnetic fields are hard to notice as a cause, it is difficult for victims to prove anomalies even when they report them.

Chapter 18 explains the specific pathways by which magnetic nanoparticles cause stomach growling, diarrhea, strange odors, increased heart rate, and throat discomfort. They are stimulation of the vagus nerve, enteric nervous system, olfactory nerve, cardiac autonomic nerves, and respiratory center. Chapter 19 also touches on behavioral control of insects and animals and shows the possibility of turning flies, bees, moths, dogs, cats, crows, and others into remotely controlled weapons.

Chapter 20 explains why external anomalies occur “within several hundred milliseconds just by thinking” through the structure in which AI issues commands in advance and uses thoughts as a synchronization signal. Massive surveillance and millisecond synchronization are impossible with humans alone, and hybrid operation of AI and humans is a prerequisite. It also touches on social engineering hacking that moves people around through location-based games like Pokémon GO and rewards, and states that strange behavior around the victim may be created by app missions. Chapter 21 summarizes that these technologies form the foundation for rulers who can carry out massacres and wrongdoing without hesitation.

Predictive Policing System ④: The Mechanism of Health Damage and “Simple Countermeasures” — Persecution of Citizens Through State Terrorism (Unfinished Version)

The central theme is the mechanisms of ten types of health damage that can be caused by magnetic nanoparticles and simple countermeasures that can be taken in daily life. Chapter 22 takes up back pain, joint pain, blurred vision, muscle spasms, itchy skin, heart attacks, cerebral hemorrhage, constipation, sleep disorders, and colon cancer. It organizes that back pain involves the spinal cord, medulla oblongata, and hypothalamus and occurs through amplification of pain signals and interference with the brake that suppresses pain. Joint pain is explained by intervention in TRPV1 sensors, immune cells, and cartilage cells; blurred vision by stimulation of the retina and visual cortex; and muscle spasms by mechanical stimulation of calcium channels.

Itchy skin is explained by histamine release from mast cells; heart attacks by effects on CaV1.2 calcium channels and autonomic ganglion plexuses; cerebral hemorrhage by loosening of the blood-brain barrier and weakening of blood vessel walls; constipation by suppression of intestinal peristalsis; sleep disorders by accumulation in orexin neurons and sleep-wake centers; and colon cancer by DNA damage from reactive oxygen species and chronic inflammation. It classifies these as “mixed type,” “voluntary-dominant,” and “involuntary-dominant” and organizes them as attacks that strike the boundary between consciousness and automatic processes.

Chapter 23 deals with the shielding effect of lead and protective clothing as radiation countermeasures. Chapter 24 explains the thermal effects of microwaves, pain on the skin surface caused by active denial systems, effects on electronic devices, and the property of water absorbing microwaves.

Chapter 25 introduces countermeasures against attacks that cause sudden drowsiness while driving a car: stopping the car, wrapping a water-soaked towel around the neck, cooling gel pads, tilting the neck 45 degrees, and putting a rechargeable battery in a bag

behind the neck. All are symptomatic treatments, and it states that magnetic field shielding is necessary for a fundamental solution.

Chapter 26 takes up South America's "death squads," "dirty war," and "caravans of death" as systems in which the government harms its citizens. It explains Argentina's state terrorism, Chile's caravan of death, and the mechanism of disappearance, and organizes that the structure in which the state is involved while pretending to be unofficial is common to gang stalking and fascism.

and academic consensus are processed as enemy propaganda. Chapter 75 explains that because real-time surveillance allows intervention before action is triggered, merely thinking of whistleblowing cuts communications, pressure is applied to workplaces and the media, and whistleblowing is buried.

Chapter 76 states that the reason motorcycle couriers, paramedics, and construction workers are used as field personnel is that they blend into daily life and can pretend to be coincidences. They generate the sound of reckless motorcycles, ambulance sirens, and construction noise in time with the target's thoughts, interfere with louder sounds even when earplugs are used, and hack the body to cause abdominal pain, nausea, and spasms. It organizes this as an application of learned helplessness and a technique connected to the CIA's interrogation manual KUBARK.

Chapter 77 cites rewards and chains of complicity as the reason ordinary citizens participate in perpetration. They recruit people by saying, "If you want to be a winner, cooperate," and once someone participates, they make them an accomplice and impossible to escape. Using examples such as Israel's large rewards and bounties in surveillance networks, it explains the structure that produces perpetrators through both domination by fear and motivation by reward.

Chapter 78 explains the reason brain-to-brain communication produces fascist groups through information asymmetry, the paradox of power, moral exemption, closed environments, and the MAGA echo chamber. Chapter 79 argues that brain-to-brain communication becomes a weapon for starting wars, terrorism, and demonstrations without leaving evidence and for selling weapons and making money. It explains the military-industrial complex structure in which war produces profit and profit produces war, the point that echo chamber groups spread and support even absurd logic, warnings to traitors, and the multilayer firewall that keeps investigation away from the masterminds.

Chapter 80 explains that people who do the right thing are put on a blacklist and justice and evil are reversed. It cites the example of Epstein case victims being called "liars" and

“prostitutes” and subjected to threats and harassment. Chapter 81 organizes that the reason war does not stop even when more than 70% of the people oppose it is that the predictive policing system prevents opposition and resistance before they occur and there is a structure in which war produces profit. Chapter 82 deals with election fraud, terrorism, and regime overthrow through riots. It explains operation input in South Korean election management committee logs, public opinion manipulation using AI videos by the Takaichi camp in Japan, transnational far-right networks in South America, sanctions against the ICC, and the characteristics of fascist regimes that do not re-verify or redo elections even when fraud is discovered. Chapter 83 summarizes that knowing, recording, and discussing become the first defense.

Predictive Policing System ⑬: “Invisible Violence” Using Nanoparticles and the “Transhumanism” That Polarizes Humanity (Unfinished Version)

The central theme is the view that invisible violence using nanoparticles and the lineage from eugenics to transhumanism polarize humanity and produce a “useless class.” Chapter 84 explains the difference between graphene oxide and magnetic nanoparticles. Graphene oxide is a chemical platform, and magnetic nanoparticles are physical tools that can be manipulated by magnetic fields. Magnetic graphene oxide, which combines the two, has both chemical bonding ability and magnetic manipulation ability. When it enters the body, it accumulates in the liver and spleen, and graphene oxide is characterized by long-term retention in the lungs. It states that MGO remains in the liver, spleen, and lungs, and some studies have observed tissue damage.

Chapter 85 deals with “invisible violence.” It cites Johan Galtung’s classification of direct violence, structural violence, and cultural violence and gives examples such as bullying, discrimination, ostracism, gaslighting, moral harassment, algorithmic discrimination, and surveillance capitalism. If thoughts and emotions can be monitored in real time, it becomes possible to accurately grasp what the other person fears most and grieves most and attack pinpointedly, and it can become a system that drives people to suicide.

Chapter 86 links eugenics with self-staged “world police play” and the “war on terror.” It is the view that providing weapons and funds to extremist terrorist organizations like ISIS and creating a structure in which Middle Eastern countries buy expensive weapons from Israel and the United States makes the war on terror self-staged. If a group that will not listen to the other side is placed on one side, conflict continues forever, and chosen-people ideology produces cults and extremists.

Chapter 87 traces the origins of eugenics to Gilgamesh’s quest for immortality and Dante’s verb “to transcend the human.” It organizes that the Old Testament “chosen people” is not about bloodline superiority or inferiority but an obligation accompanying a covenant with God, and that there are also Orthodox Jews who have fought Zionist

chosen-people ideology as heresy. At the end of the 19th century, Galton systematized eugenics; in the early 20th century, forced sterilization laws were established in the United States, the Rockefeller Foundation provided funding, and the Nazis used it as a reference. In the T4 operation, about 250,000 people with disabilities were killed, and the Empire of Japan also justified aggression and massacre in Asia through imperial ideology and eugenic discourse. It emphasizes that massacre begins with hate speech.

Chapter 88 explains that after eugenics became taboo after the war, Julian Huxley coined the word transhumanism and rebranded eugenics. It deals with 1980s cryonics, 1990s extropianism, 2000s NBIC convergence and singularity theory, Elon Musk's Neuralink, monkey deaths in animal experiments, and the danger of external manipulation of consciousness and memory. It organizes that cybernetic cyborg soldiers are a means of completing, instantly within one individual's brain, the creation of desirable traits and removal of undesirable traits that eugenics aimed at.

Chapter 89 introduces H. G. Wells's prophecy of "two human species" and Harari's theory of the "useless class." A small elite becomes superhuman with expanded capabilities through AI and biotechnology, while the majority are deprived of work by AI and become economically and politically unnecessary. It also shows the view that Opimas's forecast of financial employment cuts and the Trump administration's Iran war and economic destruction are becoming a process that mass-produces the useless class.

Chapter 90 summarizes the mechanism by which brain-to-brain communication makes echo chambers impossible to rebut and produces fascist groups. When thoughts themselves are shared, external facts and evidence are invalidated, and groups that do not admit guilt are born. Information asymmetry produces the sense of the eye of God, the paradox of power and moral exemption destroy empathy, and closed environments cultivate values that emphasize loyalty and domination. It explains the structure in which people who do the right thing are put on a blacklist, justice and evil are reversed, war does not stop, and fascism expands its influence. Finally, it organizes that continuing to ask why is the first step toward not complicit in this structure.

Predictive Policing System ⑤: State Terrorism and Bullying Have the Same Structure — Decoding the “Invisible Disguise” of Perpetrator Organizations (Unfinished Version)

The central theme is why perpetrator organizations are invisible, how they increase perpetrators, and the view that state terrorism and school bullying have the same structure. Chapter 27 emphasizes that state terrorism, in which the government harms its citizens, is not a story from a distant country in the past, and that perpetrators are hidden among ordinary civilians.

Chapter 28 cites “outsourcing to the private sector” as the reason perpetrator organizations are invisible. It explains the history in which Palantir was founded immediately after TIA was stopped by Congress, and the CIA’s investment arm In-Q-Tel became the sole investor. It is a structure in which surveillance work that would be criticized if the government did it directly can be carried out as contracted work by a private company. In Japan as well, it cites the example of a security company advised by a former Superintendent General creating a list of opponents to the Henoko relocation and states that the police’s surveillance function has been transplanted to the private sector.

It also deals with disguise as right-wing groups, cults, and religions. Even if they engage in strange activities, they can get by as “enthusiastic believers,” making them harder to pursue. Using examples such as the Japan Conference, the Unification Church, Christian evangelicals, and MAGA, it shows the view that penetration into the center of political power is advancing.

Chapter 29 explains the reward system as the reason ordinary people participate in perpetration. It cites the example of the Israeli government promising large rewards for information on hostages’ locations from Gaza residents, bounties in surveillance networks, and the gamification of Blue Wolf, in which soldiers compete to photograph

Palestinians. It also shows the example of a right-wing activist receiving 700,000 yen a month in the Kansai Ready-Mixed Concrete incident, the CIA using criminals as pawns, and relationships with General Noriega and Japanese yakuza.

Chapter 30 explains the perpetrator organization as the same pyramid structure as the demons in Demon Slayer. The powerful, wealthy, and financial elites corresponding to Muzan at the top move lower-level perpetrators using rewards and the desire for approval as bait. It organizes Nazi division of labor, euphemism, obedience to orders, and the erasure of guilt through rewards and promotion as “devilish system design.”

Chapter 31 states that state terrorism and school bullying have the same structure and explains the four-layer structure of bullying and the “six phases of organized targeting”: selection, surveillance, stalking, destruction of credibility, attack, and continuous surveillance. Chapter 32 explains why bullying generates profit through an exploitation list including homework, extortion, errands, sexual exploitation, scapegoating, emotional garbage dump, group cohesion, superiority, and chains of complicity. Domination through fear and the absence of escape are the common structure, and it organizes that the same thing is happening at the community and national levels.

Predictive Policing System ⑥: The Fear of Being Monitored — Why “Decent People” Are Driven to Suicide or Betrayal (Unfinished Version)

The central theme is why gang stalking drives people to suicide, special perpetration tactics, and the fear produced by monitoring thoughts and emotions. Chapter 33 cites the ability to monitor the other person's brain and emotions as the difference from ordinary bullying. Because fear, sadness, complaints, anger, and resignation can be grasped in real time and the timing and weaknesses that cause the most suffering can be attacked pinpointedly, it can become a system that drives people to suicide. It explains that even if sounds are blocked with earplugs or earmuffs, the sound is made louder based on reactions, making people feel there is no escape.

It also shows the view that construction workers and delivery workers may become part of monitoring and cause sounds and visits at convenient times. It organizes that sudden insects, silent calls, and sales calls are also aimed at frightening people and making them compliant. Furthermore, it criticizes the logic that “something is right because the enemy dislikes it” as circular reasoning and the logic of perpetrators. It cites the case in the Hyogo Prefecture whistleblower document issue in which the whistleblower and the former prefectural assembly member who pursued the matter died and states that this functions as a warning that pursuing those in power will destroy you.

Chapter 34 deals with special perpetration tactics. It explains the phenomenon of oncoming car headlights being glaring through two routes: microwave attack on the light source side and stimulation of the retina and visual cortex on the receiver side. Story theater is a psychological operation that stages coincidences in public spaces, traps the target in a subjective situation, and systematically destroys sanity. False flag operations are used to hide the true culprit and make the victim fight unrelated people. Echo chambers function to share and spread fabricated victim images, make victims feel self-loathing, and hide the true culprit.

Chapter 35 presents five dangers that arise from monitoring thoughts and emotions: complete emotional manipulation, perfect gaslighting, complete grasp of weaknesses, preemptive domination, and complete design of torture. It becomes possible to strike at the moment the other person is weakest, break their perception of reality, destroy support networks, block counterattacks in advance, and accurately choose the method that causes the most suffering. Chapter 36 summarizes the reasons perpetrator organizations are invisible through private outsourcing, rewards, using criminals as pawns, cult disguise, and the same six phases as bullying. It organizes that victims are made out to be mentally ill or conspiracy theorists and are isolated.

Predictive Policing System ⑦: The “Ruler Psychology” That Makes Communication Impossible, Created by “Brain-to-Brain Communication,” and Countermeasures Against Nanoparticles (Unfinished Version)

The central theme is the psychological mechanism by which the ability to monitor the other person's thoughts and emotions through brain-to-brain communication leads to domination without negotiation, and countermeasures against magnetic nanoparticles. Chapter 37 explains that when the other person's limits and seriousness become visible, uncertainty disappears, negotiation becomes unnecessary, and the other person turns into an object of manipulation. Because the timing of surrender can be measured accurately, attacks can continue until the person surrenders. It organizes the overlap of a sense of power and omnipotence, dehumanization, zero-sum thinking, sadism and the desire to dominate, decreased empathy, moral exemption, self-selection and closed environments, and feedback loops from successful experiences.

Chapter 38 deals with the history of the U.S. military's brain-to-brain communication technology. The Silent Talk program began in 2009 under DARPA and aimed to read neural signals before speech with EEG and communicate without speaking aloud. The N3 program began in 2018 and aimed at technology enabling bidirectional communication between the brain and machines without surgery. It explains BrainSTORMS' magnetoelectric nanotransducers, MOANA's gene therapy and light, writing to magnetic nanoparticles, sharing of visual information, and the concept of soldiers operating drones and robots with their thoughts. It also touches on its introduction on NHK's Close-Up Gendai.

Chapter 39 presents countermeasures against the magnetic nanoparticle system by layer. N95 masks to reduce inhalation, air purifiers, and nasal irrigation. The “three 60 rules” to reduce the effects of magnetic fields and electronic devices, cleaning earphones and smartphones, device management during sleep, and protective fabrics containing magnetic and silver nanoparticles. Dietary fiber, water, exercise, and blood purification to promote excretion of particles that have entered the body. Melatonin, omega-3, vitamins

C and E, polyphenols, curcumin, and linalool for neuroprotection and antioxidation. Methods to avoid everyday magnetic field sources, arrange the bedroom environment, and record symptoms.

Chapter 40 summarizes that information asymmetry produces the sense of the eye of God, predictive superiority turns the other person into an object of manipulation, disuse of empathy advances dehumanization, moral exemption erases guilt, and self-selection and closed environments cultivate the ruler temperament. It is the view that this mechanism has the same psychological foundation from bullying to international conflict, and brain-to-brain communication technology functions as a device that makes domination more efficient and removes hesitation.

Predictive Policing System ⑧: Nanoparticles That Manipulate the Human Body Even with Electric Fields — A Future in Which Complete Surveillance Makes Elections Impossible and the Far Right Rules (Unfinished Version)

The central theme is the possibility of manipulating the human body not only with magnetic nanoparticles but also with electric fields, and the future prediction that complete surveillance will make elections and democracy impossible. Chapters 41 to 43 state that as an anomaly after the blog was published, even when electric and magnetic fields were reduced to zero inside a simple Faraday cage, a 2 V/m electric field arose and stomach growling attacks began. It emphasizes that there is no escape and points out its character as a program for crushing whistleblowers and covering things up. It organizes that monitoring controls the victim's reactions, misleads them, and prevents them from reaching the truth.

Chapter 44 explains piezoelectric nanoparticles and electric-field-responsive nanoparticles as nanoparticles that move with electric fields. Piezoelectric nanoparticles generate electrical pulses through ultrasound, stimulate the vagus nerve, and enhance intestinal peristalsis. Electric-field-responsive nanoparticles respond directly to external electric fields and stimulate nerves and smooth muscle in the intestinal wall. The only difference from magnetic nanoparticles is the energy used for manipulation; they are similar in ultimately artificially changing intestinal movement to cause stomach growling.

Chapter 45 explains 2 V/m as a switch for reflex through the vagus nerve and 148 V/m as a strong electric field that directly moves smooth muscle and nanoparticles. At 2 V/m, intestinal peristalsis is enhanced through vagus nerve sensory fibers, the nucleus tractus solitarius in the brainstem, and parasympathetic reflex. At 148 V/m, calcium channels open and smooth muscle contracts, and it organizes that nanoparticles can move muscles even at lower electric fields.

Chapter 46 introduces the experience of wrapping a water-soaked sponge around the waist to ease pain during the period of obstruction of going out, and the case in which a large amount of powdery substance was generated on the sponge. Chapter 47 explains that N3 soldiers can monitor the enemy's brain activity and read killing intent, attack intent, and the next move ahead of time, enabling a way of fighting close to future prediction. If multiple soldiers share thoughts, perfect coordination becomes possible without radios or orders, and one-sided slaughter against ordinary armies becomes possible.

Chapter 48 argues that normal elections cannot be held under complete monitoring. Because the surveillance side can grasp voters' thoughts, emotions, hesitation, motivation to vote, and seeds of abstention before action, it can preemptively crush opposition party surprises, policy announcements, street speeches, and emergency press conferences. It cites systems like Palantir's Gotham, the spread of fabricated opposition images through echo chambers, management of voting motivation, the fact that social media itself has become a tool of surveillance, and the revelation that masks knew election results in advance. Chapter 49 summarizes the mechanism of nanoparticles that can be controlled by electric fields and organizes that knowing and recording are the first acts of resistance.

Predictive Policing System ⑨: Is the “Gang Stalking” That Terrorizes Ordinary Citizens the Urban Warfare of “N3 Soldiers”? (Unfinished Version)

The central theme is the view that gang stalking, which terrorizes ordinary citizens, may have a structure like urban warfare by N3 soldiers or the security business. Chapter 50 points out the possibility that the perpetrator side has multiple manipulation channels such as electric fields, magnetic fields, ultrasound, and light and combines them depending on the situation. Chapter 51 explains that N3 soldiers read the other person's movement readiness potential, emotional patterns, direction of attention, and autonomic fluctuations and can probabilistically predict actions several hundred milliseconds to several seconds ahead.

Chapter 52 gives specific tactics in everyday spaces. In motorcycle pursuit and encirclement, they take a course before the target is conscious of trying to turn. In convoy operations, a lead vehicle, parallel vehicles, a rear vehicle, a disguised ambulance, oncoming cars, and drones overhead coordinate and act ahead by reading intent to counterattack or escape. Ambulance sirens are sounded at the moment the person thinks of resistance, carrying out intimidation and conditioning and encouraging self-censorship. It states the possibility that the phenomenon of customers suddenly gathering at supermarkets and Daiso involves AI sending missions and points to people nearby and moving them in a game-like way. The timing of construction noise and deliveries is also explained as a tactic that monitors thoughts and actions and pretends to be coincidence. Circling overhead and low-altitude flights are also intimidation that makes people aware their lives are being monitored.

Chapter 53 deals with the structure in which repression produces backlash, and backlash produces budgets. Facial recognition, surveillance cameras, house raids, and summons in Palestine incorporate the feeling of being watched into daily life and function as psychological terrorism. Repression produces backlash, backlash becomes a pretext for restoring security or counterterrorism, and justifies budgets for war and security. Harassment in everyday spaces functions as a warning and intimidates the entire

community. It explains the cycle in which budgets in the name of safety continue to require surveillance and repression.

Chapter 54 explains the phenomenon of cuts and bruises appearing on the skin without the person knowing through weakening of skin tissue due to oxidative stress, destruction of cell membranes by electric fields, and unconscious scratching. It shows the possibility that strong electric fields open holes in cell membranes as in electroporation, and the rotation and vibration of magnetic nanoparticles damage membranes. Chapter 55 introduces SQUID biosusceptometry, fecal magnetic measurement, and magnetic particle spectroscopy as research-level technologies for detecting nanoparticles in urine and feces. There are no household kits, and it states that keeping records is realistic.

Chapter 56 explains that even if the head is covered with metal, the mechanisms of shielding differ between electric fields and magnetic fields. Aluminum foil is somewhat effective against electric fields and high frequencies but cannot block static magnetic fields. Shielding magnetic fields requires high-permeability alloys such as permalloy or mu-metal, and complete sealing is difficult, and it does not remove particles that have entered the body.

Predictive Policing System ⑩: The History of Brain-to-Brain Communication Technology Development and the Mechanism of the “Two-Polarization of Perpetrators and Victims” (Unfinished Version)

The central theme is the view that brain-to-brain communication is not a delusion but a technology researched for more than 80 years, and the difference in nanoparticles used for perpetrators and victims produces polarization. Chapter 57 organizes that dismissing the experience of thoughts leaking outside as persecutory delusion of schizophrenia is a mistake, and that governments and intelligence agencies have researched it.

Chapter 58 divides the research history into four periods. The first period is the Cold War–era MKUltra project and Project Copperhead. MKUltra aimed at mind control through LSD, hypnosis, and sensory deprivation, and the 1977 Senate hearings are said to have mobilized 80 institutions, 185 researchers, and 149 subprojects. Project Copperhead aimed at espionage and crime prevention through telepathy, and the ARD device was developed but ended in failure. The second period is the 2009 DARPA Silent Talk program, which aimed at technology to read neural signals before speech with EEG and communicate without speaking aloud. The third period is the N3 program and BrainSTORMS from 2018, a concept of injecting magnetoelectric nanotransducers, guiding them to target brain regions with magnetic fields, and realizing bidirectional communication. In 2026, N3 was declared complete, but details are unknown. The fourth period is nanoparticle bidirectional BCI research after 2026, and MENPs are predicted to enable neuromodulation and recording with submillimeter spatial resolution and millisecond temporal precision. It also touches on the publication of documents by European Parliament members and statements by DARPA advisers.

Chapter 59 explains the perpetrator organization as a pyramid structure. The first layer is intelligence agencies such as the CIA, NSA, Mossad, and the Public Security Intelligence Agency; the second layer is the command center of private companies and military leaders; the third layer is N3 soldiers who actually carry out surveillance and attacks; the

fourth layer is bystander collaborators moved by games and points; the fifth layer is bystanders; and the sixth layer is victims.

Chapter 60 explains the difference in nanoparticles used for perpetrators and victims. Perpetrators communicate bidirectionally through magnetoelectric nanotransducers and can both read and write. Victims are one-sidedly stimulated by iron oxide magnetic nanoparticles, causing pain, spasms, diarrhea, increased heart rate, and other effects. Even with the same magnetic nanoparticles, N3 prioritizes information accuracy, while attacks prioritize stimulation intensity. If N3's writing function is misused, it can become mind control that sends nightmare-like imagery, artificial sensations, and impulses. Chapter 61 summarizes that communication and attack are not separate technologies but two sides of the same technology and become the technological foundation supporting a polarized society of winners and losers.

Predictive Policing System ⑪: The Terrifying “Communication” Method with Invisible Perpetrators — The Structure of Domination Created by Thought Surveillance and Physical Attacks (Unfinished Version)

The central theme is the explanation that the contradictory situation in which victims sense the perpetrator’s message even though they do not know the perpetrator’s identity is established through the synchronization of thought surveillance and physical attacks. Chapter 62 organizes that victims have their thoughts and emotions monitored in real time, receive physical attacks such as abdominal pain, stomach growling, spasms, and palpitations, and also undergo manipulation of dreams and thoughts. The perpetrator side can share information as if the brains of multiple soldiers were one network and coordinate attacks through brain-to-brain communication.

Chapter 63 explains that the reason the perpetrator’s identity is unknown is the same design as bullying. While it is not visible who started it or who is giving instructions, the surrounding audience and bystanders make the perpetration structure itself invisible. Threatening while hiding one’s figure is to avoid what could be settled by showing one’s face and talking, and for “staging consent” so that after the victim obeys, it looks as if they “consented voluntarily.” Because emotions and thoughts are monitored, it is possible to continue persistent psychological attacks while grasping which attack is most effective.

Chapter 64 explains the mechanism of sound attacks in five stages. MENPs convert the brain’s electrical signals into magnetic signals, and AI decodes them in milliseconds. N3 soldiers share the victim’s thought state through brain-to-brain communication, and AI sends individual commands to airplanes, reckless motorcycles, ambulances, and others. It calculates the speed of sound propagation and acts ahead so that the sound arrives at the moment the victim has a specific thought. When the synchronization of thought and sound is repeated, the brain learns that “thinking or acting brings unpleasant sounds,” and self-censorship and learned helplessness occur in which thoughts are stopped unconsciously.

Chapter 65 explains attacks using surrounding people on trains and buses. The tactics include riding at the same time, in the same car, from the same door irregularly; making eye contact for just a moment; positioning so that someone is always at the edge of the field of view; mirroring actions; reacting to smartphones, coughing, or names; the train stopping at the moment the person gets angry at the harassment; stopping for several days and resuming when the person feels safe. This produces suspicion, distrust of people, and withdrawal, and spreads rumors and bad reputations about victims who can no longer interact with the outside, advancing advance destruction of credibility.

Chapter 66 explains the mechanisms of stomach growling, diarrhea, and strange odors as body hacking. Magnetic nanoparticles stimulate the vagus nerve, enteric nervous system, and olfactory nerve, manipulating peristalsis, water secretion, and smell. When the person tries to go out, they are made to withdraw through torture such as back pain, joint pain, diarrhea, blurred vision, and drowsiness. The reason confined rooms and closed spaces with no escape are important is that, like sexual violence and the blockade of Gaza, the perpetrator reveals their true nature after creating a state in which help cannot be sought from outside. Digital technology creates an invisible closed room through inability to send, Wi-Fi disconnection, telephone failure, and inability to log in to social media.

Chapter 67 explains that “communication with the invisible perpetrator” is established through classical conditioning. By repeating unpleasant stimuli such as stomach growling, notification sounds, sirens, and communication cuts immediately after specific thoughts, the victim’s brain links specific thoughts with unpleasantness. The perpetrator conveys without words: “I see all your thoughts,” “If you disobey, you will suffer,” “You cannot ask anyone for help,” “There is no way but to obey.” Chapter 68 organizes that as a result of learning that not doing so brings terrible consequences, it is a technology of “making people destroy themselves voluntarily,” in which contradictory words and actions occur spontaneously, such as poor ordinary people supporting tax increases, criticizing sexual violence victims, or agreeing to war, constitutional revision, and conscription.

Chapter 69 explains the pyramid structure of the perpetrator organization and its public and hidden faces. Publicly they play the role of honor students, good people, and serious citizens, but behind the scenes they reveal their true nature the moment they are convinced there is no escape. When this happens at the national level, it becomes the duality of fascism: democracy on the surface and repression behind the scenes. Even when exposed, they switch the subject and shut things down with labels such as “fake news,” “conspiracy theorist,” “mentally unstable,” and “anti-Semite.” To erase guilt, rewards, division of labor, anonymity, euphemism, immersion in the system, and approval from peers are used. Chapter 70 states that security has become a word that protects the safety of rulers rather than ordinary people, and summarizes that brain-to-brain communication gives perpetrators an invisible group chat and victims an invisible cage. Knowing, recording, and connecting are the first acts of resistance.

Predictive Policing System ⑫: Why Do “People Who Do the Right Thing” Become Victims? — The Brain-to-Brain Communication Network That Manufactures War, Terrorism, and Election Fraud (Unfinished Version)

The central theme is why people who do the right thing become victims, and the view that the brain-to-brain communication network manufactures war, terrorism, and election fraud and expands fascism. Chapter 71 explains that the reason victims do not understand why they are attacked is that the target selection process is invisible. It cites the six phases of organized targeting: selection, surveillance, stalking, destruction of credibility, attack, and continuous surveillance.

Chapter 72 explains that the reason appeals to the police, government, lawyers, and the media are treated as if they never happened is preemptive pressure through the brain network. The moment a victim thinks of consulting someone, their thoughts are monitored, communications are cut, pressure is applied to the relevant parties, and the whistleblowing is buried. It also touches on the issue raised in the U.S. Congress that Palantir's technology builds a mass surveillance ecosystem and is weaponized against citizens and journalists engaged in constitutionally protected activities.

Chapter 73 cites disguise as cults and virtues as the reason perpetrator organizations blend into daily life. Ordinary daily activities such as cleaning toilets by hand, putting up signs encouraging early rising, doing farm work, sitting on church pews, and drinking coffee at a diner become disguises pretending to belong to religious or conservative groups. It shows the view that grassroots networks such as the Japan Conference, Christian evangelicals, and the Unification Church are cutting into the center of politics.

Chapter 74 explains how the echo chamber of brain-to-brain communication differs from ordinary echo chambers. Ordinarily, language is involved, so there is room for doubt, but brain-to-brain communication shares thoughts themselves, so room for rebuttal disappears. When historical revisionist discourse is shared, external historical evidence
